Altayeb

I am a self-taught full-stack developer. I build and run my own products, including a school management system, a multi-store commerce platform and an offline restaurant cashier, and I handle the design, backend, deployment and maintenance.

REMOTE ONLY · PART-TIME OR CONTRACT · UTC+2 · ARABIC (NATIVE) & ENGLISH

SUMMARY

I plan, build and run my own products. Three are live: Manhaj, 1AR and Mals Pay; Durj is in development. AI-native: I build by directing AI coding agents and own the product, architecture and infrastructure decisions.

EXPERIENCE

Independent full-stack developer • Self-employed 2024 TO PRESENT · REMOTE

- I take a product from the first written spec to launch, and keep fixing it after.
- I design how each product stores data, keeps customers apart and handles money.
- I run my own production servers: one Linux server hosts many products, with resource limits per service, TLS, off-site backups, self-hosted CI and monitoring.
- I build web and mobile products for clients under agreement, from the first version through store releases and ongoing changes.

SELECTED WORK

Manhaj: school management 2026 · MANHAJ.MALS.APP

Attendance, homework, grades, fees and messages, with a separate web portal for the manager, the teacher, the parent and the pupil. A school pays only for the modules it turns on, and it keeps working on weak connections.

1AR: multi-store commerce platform 2026 · 1AR.MALS.APP

Each merchant gets a storefront, a domain, customers and a wallet in one system. Balances are funded in USDT, which works where card payments do not reach. A retried payment is charged once.

Mals Pay: USDT payment gateway 2026 · PAY.MALS.APP

Each invoice pays straight to the merchant's wallet through a one-time address nobody can redirect. Signed webhooks, 2FA, 24-hour lock on payout changes.

Durj: restaurant cashier IN DEVELOPMENT

A till built to keep selling and closing shifts for days without internet, then sync when back online.

Other client work is covered by agreements. I can talk about it on request.

WHAT I BRING

AI: Directing AI coding agents; LLM automations that triage, draft and hand off to a human
Product: Business rules, screens and priorities, pricing and plans, market fit
System design: Multi-tenant platforms, offline-first apps, payment and wallet flows, client and backend split for low hosting cost
Stack: TypeScript, Go, Flutter, PostgreSQL, Redis
Operations: Docker, Linux servers, Cloudflare, CI/CD, backups and restore, monitoring and alerts

HOW I WORK

- Study and plan first, then build, test and ship.
- I ship end to end and answer for the product after launch.
